01 At a glance

The facts you need before writing to or about Bunsy. One-liner, company, platform, price entry point, support.

What it is	An AI video generator *and editor* for iOS and Android — generate, edit and publish on the phone. The website itself is guides, a model catalogue and pricing; it is not where you generate.
One-liner	"Bunsy — express yourself with AI." (footer tagline)
Platforms	iOS (App Store) and Android (Google Play). Same catalogue and same editor on both.
Company	QUICK AI SOFTWARE SOLUTIONS HUB - FZCO, Trade License No. 80532, Registration No. 78782, IFZA Business Park, DDP, PO Box 342001, Dubai, United Arab Emirates.
Support / contact	support@bunsy.io — the only contact address published anywhere on the site (support, privacy, IP complaints and abuse reports all route here).
Pricing entry point	Free to download; generation runs on credits. Cheapest subscription is €9.90/week (Basic, 500 credits); cheapest monthly is €15/month (Basic, 800 credits).
Model catalogue	The catalogue page compares 5 model families: Nano Banana, Grok Imagine, Runway, Veo 3.1, GPT Image. Median across them: 9 credits, ~77s.
Age / eligibility	18+ (or the higher age of majority where you live). One account per person.
NSFW	Explicitly and absolutely banned — no uncensored or "no filter" mode exists. Prompts are screened before image and video generation.
App Store	apps.apple.com/us/app/ai-video-generator-bunsy/id6762499422
Google Play	play.google.com/store/apps/details?id=com.qupuquick.app

---

02 Positioning & messaging

Bunsy's own words, quoted verbatim. Use these when you need to describe the product accurately in an outreach email or DM — these are the claims the company itself makes.

> *"Most tools treat an AI video generator as the end of the process. Bunsy treats the clip as raw footage: generate with the model that suits the shot, then trim, retime, subtitle and add sound in the same project."*
>
> — /ai-video-generator

> *"Anything can hand you a clip. Bunsy hands you the cut."*
>
> — /get, the editor section. This is the core differentiator they repeat: the timeline.

> *"No second subscription to try a second model."*
>
> — /ai-models — every model sits behind one prompt box, one credit balance.

> *"Pay per render, not per month. Tokens are spent when you generate. Nothing renders in the background, and an idle month costs nothing."*
>
> — /ai-video-generator

> *"Real output, straight from the app. Every clip here came out of Bunsy exactly as you see it — no colour grade, no outside edit."*
>
> — showroom / "Made in Bunsy" section, on every page

The four-step pitch (their own ordering)

1. **Generate** — a prompt or a photo, any model in the catalogue, plus talking avatars, lip sync and dubbing with a voice you preview first.
2. **Or let the AI Director do it** — describe the goal; it reads the trend, writes the script, picks the models and builds the workflow.
3. **Make it yours** — found a video you like? Add your photo and get your own version of it.
4. **Post it** — to the Bunsy feed, or export and post anywhere.

Source: /get (identical section on the home page) `https://bunsy.io/get`

Editor claims — the ones to lead with on a creator pitch

- **A frame-accurate timeline** — trim, reorder and layer clips where you can see them, instead of re-prompting and hoping.
- **Subtitles that know who spoke** — automatic transcription with speaker labels, editable cue by cue before you burn them in.

- **0.25× to 4×, pitch-corrected** — retime a clip without the audio turning into a chipmunk; the pitch follows the speed.
- **Node editor** — some shots need more than one model, so wire them together. A still from Nano Banana becomes the frame Seedance animates. Save the graph and re-run it with a different prompt.

Source: /get `https://bunsy.io/get`

03 Pricing

All prices in EUR. The app is free to download; generation spends credits from a subscription or a one-time pack.

Subscriptions — monthly

PLAN	PRICE	CREDITS EACH MONTH	NOTES
Basic	€15 / month	800	—
Plus	€29 / month	1,800	Marked “Popular”
Pro	€99 / month	8,000	—

Subscriptions — weekly

PLAN	PRICE	CREDITS EACH WEEK	NOTES
Basic	€9.90 / week	500	—
Plus	€19.90 / week	1,000	Marked “Popular”
Pro	€39.90 / week	2,000	—

One-time credit packs (no subscription)

PRICE	CREDITS	NOTES	CREDITS PER €
€30	2,000	—	66.7
€50	3,400	—	68.0

PRICE	CREDITS	NOTES	CREDITS PER €
€100	7,500	10% volume discount	75.0
€200	14,900	10% volume discount	74.5

what a credit actually costs. Best rate is the €400/€500 tier at 89 credits per euro, the worst is €30 at 66.7.

Billing terms

- **Who charges you** — in the iOS and Android apps you pay Apple or Google at the localized store price. Website checkout is stated as **Stripe** on the pricing page and **Creem** on the terms and privacy pages. See section 08.
- **Credits are not money** — "a limited-use digital entitlement for generation, not cash". Generally non-refundable once spent.
- **No rollover** — unused subscription credits do not roll over to the next period unless stated otherwise in the app.
- **Cancelling** — store subscriptions cancel in Apple or Google settings; website billing is cancelled by emailing support@bunsy.io.
- **Subscriptions auto-renew** until cancelled.
- **No free tier for generation** — "Bunsy is a paid AI video app. The app itself is free to download."
- **Both routes land on one balance** — a plan or pack bought on the website works in the app on the same account.

04 Model catalogue

The catalogue is live — Bunsy says it is "refreshed hourly" and comes from the same source the app's model picker reads. Prices are per run, in credits.

Video generation modes

MODEL	GENERATION MODE	FROM, CREDITS	ESTIMATED WAIT	VARIANTS
Grok Imagine	Grok Imagine Video 1.5	11	~77s	Text to Video, Photo to Video
Grok Imagine	Grok Imagine · Text to Video	9	~89s	Text to Video
Grok Imagine	Grok Imagine · Image to Video	52	~2 min	Image to Video
Runway	Runway AI Gen4	11	~75s	Not listed
Runway	Runway Aleph 2	333	~3 min	Aleph 2 — video to video
Veo 3.1	Veo 3.1	225	~5 min	Lite, Fast, Quality
Veo 3.1	Veo 3.1 · Reference to Video	54	~4 min	Lite, Fast

Image generation modes

MODEL	GENERATION MODE	FROM, CREDITS	ESTIMATED WAIT	VARIANTS
Nano Banana	Nano Banana 2	7	~50s	Text to Image, Image to Image
Nano Banana	Nano Banana Pro	10	~72s	Text to Image, Image to Image
Nano Banana	Nano Banana 2 Lite	4	~52s	Text to Image, Image to Image
GPT Image	GPT Image 2.5	5	~2 min	Text to Image, Image to Image

Source: /ai-models `https://bunsy.io/ai-models` Bunsy's own caveat: "Starting prices can use different durations, resolutions or settings. Wait times are catalogue estimates. These figures do not measure quality or compare identical renders."

The five families in the picker

IMAGE · 3 MODES · FROM 4 CREDITS

Nano Banana

Google's image model for fast, prompt-based generation and editing. Great for quick creative concepts, character consistency, and natural-language tweaks to existing photos.

- **Nano Banana 2** — 7 credits, ~50s. Uses live web knowledge, so real places, products and facts come out accurate.
- **Nano Banana Pro** — 10 credits, ~72s. Sharper detail, readable text inside the image, stricter prompt following.
- **Nano Banana 2 Lite** — 4 credits, ~52s. Fastest and cheapest; quick drafts, bulk edits, lots of variations.

Source: /ai-models/nano-banana-2

VIDEO · 3 MODES · FROM 9 CREDITS

Grok Imagine

xAI's Grok Imagine — turns text or an image into a short video with coherent motion and synchronized audio. Served through kie.ai.

- **Grok Imagine Video 1.5** — 11 credits, ~77s. Newest; from a text prompt or your photo, at 480p or 720p.
- **Grok Imagine · Text to Video** — 9 credits, ~89s. Text prompt only; pick speed or quality mode, length and resolution.
- **Grok Imagine · Image to Video** — 52 credits, ~2 min. Animates your photo, guided by a text prompt.

Source: /ai-models/grok-imagine

VIDEO · 2 MODES · FROM 11 CREDITS

Runway

Runway's platform is used by major film studios, advertising agencies, and independent creators to streamline production and VFX workflows.

- **Runway AI Gen4** — 11 credits, ~75s. Gen-4 Turbo: a clip from a text prompt or animates your photo, keeping characters and objects stable across the shot.
- **Runway Aleph 2** — 333 credits, ~3 min. Prompt-based *video editing*: upload a clip and describe the change; scene, length and framing are preserved.

Source: /ai-models/runway

VIDEO · 2 MODES · FROM 54 CREDITS

Veo 3.1

Google DeepMind's flagship video model via kie.ai. High-fidelity footage with strong prompt adherence and native audio generation.

- **Veo 3.1** — 225 credits, ~5 min. Cinematic clips from a text prompt or a photo, with native synced audio. Lite, Fast and Quality tiers.
- **Veo 3.1 · Reference to Video** — 54 credits, ~4 min. Lite and Fast tiers.

Source: /ai-models/veo

IMAGE · 1 MODE · FROM 5 CREDITS

GPT Image

OpenAI's GPT Image 2 generation. Strong at following detailed prompts, rendering legible text in images, and producing polished, photorealistic results.

- **GPT Image 2.5** — 5 credits, ~89s (catalogue table says ~2 min). It reasons about the prompt before drawing, so text inside the image and small details come out right. Up to 4K.

Source: /ai-models/gpt-image

Bunsy's own advice on choosing a model

1. Match the input and output — start with the job: text to video, animating a reference image, or a still.
2. Keep the settings comparable — same prompt and reference image, matched duration, aspect ratio, resolution and audio.
3. Check the result against your brief — subject consistency, motion, camera movement, unwanted frame changes.
4. Compare the *total cost of a usable result* — quoted credits, actual wait, and number of attempts. "A lower starting price alone does not tell you how much it will cost to produce the shot you want."

Source: /ai-models, "How to choose AI video and image models for your project"

05 Feature & use-case pages

All 25 landing pages, in the same order the site's own footer uses. Each card gives the page's headline, its tagline verbatim, what the page actually covers, and every FAQ answer it publishes. Expand the FAQ box for the exact wording.

Generate 7 pages

GENERATE

An AI video generator that finishes the job

Generate, edit and publish without leaving your phone.

- **Choose a model in your AI video generator** — A wide establishing shot and a talking close-up do not want the same model. Bunsy keeps the whole catalogue behind one prompt box, so switching costs a tap instead of another subscription.
- **Generation is step one** — The timeline is where a video is actually made. Cut between takes, fix the pacing, add captions that know who is speaking, and export something finished.
- **Pay per render, not per month** — Tokens are spent when you generate. Nothing renders in the background, and an idle month costs nothing.

▶ 3 FAQ answers on this page

Source: ai-video-generator `https://bunsy.io/ai-video-generator`

GENERATE

Text to video, then a real cut

Describe the shot. Choose the model. Keep editing.

- **One text-to-video prompt, any model** — Send the same description to a different model when the first result misses. No re-learning an interface, no second app.
- **Aspect and length are settings** — Vertical for Shorts, wide for a landing page, square for a feed post. Pick per generation instead of per tool.
- **Batch a scene, not a clip** — Generate several takes of the same prompt at once, keep the one that works, and drop it straight onto the timeline.

▶ 3 FAQ answers on this page

Source: text-to-video `https://bunsy.io/text-to-video`

GENERATE

Image to video, from a still you already have

Animate a photo, move a product, extend a frame.

- **Image to video from your own photo** — Bring a portrait, a product shot or a piece of artwork to life without describing it from scratch.
- **First and last frame** — Give two stills and let the model fill the shot between them — the

GENERATE

An AI video editor that can also generate

The timeline is where a video is made.

- **Trim, retime and reorder in the AI video editor** — Ordinary editing, done properly on a phone. Frame-level trimming, speed changes and clip reordering — the operations a cut is actually made of.
- **Generate into the gap** — Missing a cutaway, an establishing shot or a reaction? Generate it

closest thing to directing a specific move.

- **Straight into the cut** — Animated stills sit on the timeline next to generated and filmed footage, with the same trimming, sound and subtitles.

▶ 3 FAQ answers on this page

Source: image-to-video `https://bunsy.io/image-to-video`

against the project you already have, and it lands on the timeline rather than in another app.

- **Sound and captions in the same pass** — Music, voiceover and subtitles are tracks in the project, not a second export cycle through a different tool.

▶ 3 FAQ answers on this page

Source: ai-video-editor `https://bunsy.io/ai-video-editor`

GENERATE

An AI image generator for stills you can animate

A picture first. Motion when you want it.

- **Set the frame with an AI image generator** — Getting a look right takes several attempts, and attempts are cheaper as stills. Fix the subject, the framing and the light first, then spend a video render on the version that earned it.
- **The same prompt box** — Image models live beside the video models behind one prompt box, so choosing between them is a decision about the shot rather than a move to a different product.
- **Then it moves** — Any still you generate can be handed to an image-to-video model, or used as the first or last frame of a shot — which is the most controllable way to direct a specific camera move.

▶ 3 FAQ answers on this page

Source: ai-image-generator `https://bunsy.io/ai-image-generator`

GENERATE

First and last frame, one shot out

Set the start, set the end, get the move.

- **Direct motion with a first and last frame** — A prompt asking for an orbit returns whatever that model thinks an orbit is. Two frames put the start and the end beyond argument, and leave the interpolation as the only open question.
- **Continuity across the cut** — Use the closing frame of one shot as the opening frame of the next and the edit has something to hold onto. It is what stops a sequence reading as unrelated clips of a similar subject.
- **Either frame can be generated** — The endpoints do not have to be photographs. A still you made with the image models, a frame pulled out of an earlier clip, a photo from your camera roll — anything in the library can anchor an end.

▶ 3 FAQ answers on this page

Source: first-and-last-frame-video `https://bunsy.io/first-and-last-frame-video`

GENERATE

Anime video, where the model sets the look

The style comes from the model, not a filter.

- **Choose an anime video model before the prompt** — Choose the model whose output already sits near the look you want, then spend the prompt on what happens in the shot. Arguing a model towards a style it does not have burns renders for nothing.
- **Hold the character between shots** — Text alone redraws a face every take. Start each shot from a still instead, and use first-and-last-frame generation, so the same character carries through a sequence rather than resetting at every cut.
- **Dialogue without a booth** — Lines can be generated as voice, lip-synced onto the character and captioned from that same audio — which is most of what a short animated scene still needs once the shots exist.

▶ 3 FAQ answers on this page

Source: ai-anime-video-generator `https://bunsy.io/ai-anime-video-generator`

Voice and faces 5 pages

VOICE AND FACES

An AI talking avatar from a single photo

A face, a voice you chose, and lips that match.

- **Preview your AI talking avatar's voice** — Every voice in the catalogue has a preview.

VOICE AND FACES

AI lip sync and dubbing that match the take

New audio, same performance.

- **AI lip sync from your own audio** — A typed script read by a catalogue voice, a voice you

Choose the delivery before you render, instead of after.

- **Lip sync that holds up** — Mouth movement is matched to the audio you supply — a script you typed, a voice you generated, or a recording of your own.
- **Then caption it** — Automatic subtitles with speaker labels, editable cue by cue, because most of this footage is watched with the sound off.

▶ 3 FAQ answers on this page

Source: ai-talking-avatar `https://bunsy.io/ai-talking-avatar`

VOICE AND FACES

AI voiceover without a recording session

A script, a voice, and it is already on the timeline.

- **Rewrite your AI voiceover without re-recording** — Change a line and generate again. The cost of fixing a script stops being a whole session, which is what actually improves the writing.
- **Pick the voice for the piece** — A tutorial, an ad and a story do not want the same delivery. The voice is a choice per project, not whoever is available.
- **It lands in the project** — Narration arrives as a track under the cut, in sync with the captions generated from the same audio.

▶ 3 FAQ answers on this page

Source: ai-voiceover-generator `https://bunsy.io/ai-voiceover-generator`

generated earlier, or a recording you made yourself.

- **Dub into another language** — Keep the footage and change the language, with a voice chosen for the delivery you want rather than the first one available.
- **Subtitles from the same audio** — Transcription runs on the track you dubbed with, so captions and speech agree instead of describing the original.

▶ 3 FAQ answers on this page

Source: ai-lip-sync `https://bunsy.io/ai-lip-sync`

VOICE AND FACES

Video translation that keeps the performance

Dub it, sync it, subtitle it.

- **Video translation with lip sync** — Dubbing replaces the audio while lip sync realigns the mouth to it, so the new track does not read as a badly overdubbed import.
- **Subtitles in the target language** — Captions are generated from the dubbed audio, which means the on-screen text and the voice agree instead of drifting apart.
- **One source, several exports** — The original cut stays intact. Each language is an audio pass over the same project rather than a fresh edit.

▶ 3 FAQ answers on this page

Source: ai-video-translator `https://bunsy.io/ai-video-translator`

VOICE AND FACES

An AI subtitle generator that knows who is speaking

Feeds autoplay muted. Plan for it.

- **An AI subtitle generator for your project's audio** — Transcription runs on the track in the project — a generated voiceover, a dubbed line, or a recording off your camera roll. Nothing is re-uploaded, so the text and the speech cannot drift apart.
- **Speaker labels, not one block of text** — A two-hander only reads as a conversation when the captions change with the voice. Cues are grouped per speaker instead of arriving as an undifferentiated wall of words.
- **Burned into the export** — Captions render into the file itself. Nothing depends on a viewer enabling a subtitle track or on a platform deciding to show one.

▶ 3 FAQ answers on this page

Source: ai-subtitle-generator `https://bunsy.io/ai-subtitle-generator`

Make 13 pages

MAKE

Video templates tuned to what is working now

Start from a format, not a blank prompt.

- **Video templates built around formats** — Each template carries the prompt and model settings behind it, so the result matches the example rather than approximating it.

MAKE

UGC ads without the creator brief

A face, a script, and a cut that sells.

- **Test more hooks for your UGC ads** — The first three seconds decide the ad. Generate the same script with five different openings, run them all, and let the numbers pick rather than the meeting.

- **Refreshed as trends move** — The catalogue is curated against what is actually performing, so it does not calcify into last season's look.
- **Remix what you see** — Find a video in the feed you like and start from its recipe, with your own subject in place of the original.

▶ 3 FAQ answers on this page

Source: ai-video-templates `https://bunsy.io/ai-video-templates`

- **The product stays the product** — Drop your own footage or a product photo onto the timeline next to the avatar. The face sells it, your shot shows it, and neither has to be re-shot for the next variation.
- **Captions that carry the sound off** — Most of the feed watches muted. Subtitles come from the same audio, land on the beat, and are part of the export rather than a second tool.

▶ 3 FAQ answers on this page

Source: ai-ugc-ads `https://bunsy.io/ai-ugc-ads`

MAKE

Faceless video, made end to end

Generated footage, a voice, captions, done.

- **Faceless video footage that fits the script** — Generate the shot the line needs instead of hunting stock that almost matches. A prompt per beat, and the visuals stop being the bottleneck.
- **A voice without a microphone** — Voiceover is generated in the same app, so a script becomes narration without a recording session or a quiet room.
- **Assembled, not just generated** — The timeline is where the episode gets its pacing: trim the dead air, drop the music under it, burn the captions in and export.

▶ 3 FAQ answers on this page

Source: faceless-video-generator `https://bunsy.io/faceless-video-generator`

MAKE

TikTok videos made this week, not last quarter

The format moves. So does the catalogue.

- **TikTok videos in a vertical frame** — 9:16 is chosen at generation time, so the shot is composed for the frame instead of cropped into it afterwards.
- **Start from a format that is working** — Templates track what the feed is actually rewarding right now, so you start from a structure rather than a blank prompt box.
- **Sound is half the video** — Lay music or a voiceover under the cut and let the captions follow it. A TikTok with the audio treated as an afterthought reads as one.

▶ 3 FAQ answers on this page

Source: tiktok-video-maker `https://bunsy.io/tiktok-video-maker`

MAKE

YouTube Shorts, at the rate Shorts demand

One idea, one vertical cut, today.

- **Build YouTube Shorts shot by shot** — Generate each beat separately and cut them tight. A Short is a structure, and structure is easier to iterate on when each piece is its own clip.
- **Narration without a recording setup** — A generated voiceover turns a written script into audio, so the episode does not wait on you finding a quiet room.
- **Captions that survive muted playback** — Subtitles come from the audio and burn into the export, which is what keeps a Short watchable in the half of sessions that never turn sound on.

▶ 3 FAQ answers on this page

Source: youtube-shorts-maker `https://bunsy.io/youtube-shorts-maker`

MAKE

Instagram Reels that look considered

Generate the shot, then actually cut it.

- **Animate your photos for Instagram Reels** — A still you like is a better starting point than a sentence. Bring a photo, get motion, and keep the look you already chose.
- **Cut for rhythm, not for length** — Retime, trim and reorder on the timeline until the beats land. This is the step that separates a Reel from a clip.
- **Type as part of the shot** — Captions are placed and timed rather than dumped in a corner, so text is part of the composition instead of a subtitle track sitting on top of it.

▶ 3 FAQ answers on this page

Source: instagram-reels-maker `https://bunsy.io/instagram-reels-maker`

MAKE

Product video from a photo you already have

The shot exists. It just is not moving yet.

- **Product video from the shot you own** — Animate the existing product photo rather than describing your product to a model that has never seen it. What is in frame stays your product.
- **Move the camera, not the object** — A slow push, an orbit or a rack focus reads as production value. First-and-last-frame

MAKE

A music video for a track nobody funded

Your song. Shots that did not exist.

- **Music video shots that follow the song** — Generate the image the lyric implies instead of settling for footage that happens to exist. A verse can have its own world and the chorus another.
- **Cut on the beat** — Lay the track down first, then trim the shots against it. Editing to audio is what makes a sequence of clips read as a music video.

generation is how you specify one instead of hoping for it.

- **Cut it for the placement** — The same footage becomes a vertical ad, a square feed post and a wide hero loop, because aspect and length are decided per export.

▶ 3 FAQ answers on this page

Source: ai-product-video `https://bunsy.io/ai-product-video`

- **Hold a look across the runtime** — Reusing the same model and prompt structure per section keeps the grade and the world consistent, so three minutes read as one piece.

▶ 3 FAQ answers on this page

Source: ai-music-video-maker `https://bunsy.io/ai-music-video-maker`

MAKE

Explainer videos built a beat at a time

A shot per point, and a voice reading the script.

- **Build explainer videos one point at a time** — Split the script into beats and generate a visual for each. A process, an abstraction, a thing that does not exist yet — the subjects with no stock footage are exactly what a prompt handles well.
- **The script drives all three tracks** — It becomes the narration, and the narration becomes the captions. Change a line and the voice and the on-screen text stay in agreement instead of quietly diverging.
- **Pacing is most of the craft** — An explainer loses people when a point outstays its shot. Trim against the narration on the timeline until each idea gets the seconds it needs and not one more.

▶ 3 FAQ answers on this page

Source: ai-explainer-video `https://bunsy.io/ai-explainer-video`

MAKE

An AI slideshow maker that puts photos in motion

Stills that move, cut to the music.

- **An AI slideshow maker that animates each photo** — A still animated by a model is not a pan across a flat JPEG. The subject shifts, the background moves behind it, and a picture you have looked at for years reads as something new.
- **Pacing per photo, not per slideshow** — One image deserves four seconds and the next one deserves half of that. On a timeline that is a trim; in a slideshow app it is a global slider you cannot argue with.
- **A voice over the pictures** — Music makes a montage. A line of narration makes it a story — generate the voiceover from what you would have said out loud and lay it under the stills.

▶ 3 FAQ answers on this page

Source: ai-slideshow-maker `https://bunsy.io/ai-slideshow-maker`

MAKE

An AI trailer maker for shots nobody filmed

A few shots, rising pace, one title card.

- **Generate the key shots with an AI trailer maker** — A teaser needs an establishing frame, a turn and a reveal. Make those three and let the cut suggest the film around them — implication is the whole form.
- **Escalation is a timeline job** — Hold the first shot, shorten every one after it, then cut to black before the title. Trims and speed changes are what build that pressure, and no preset can guess where your beats are.
- **The end card is a generation too** — Bunsy makes stills as well as video, so the closing frame is one more render you drop on the timeline and hold, with the music bed and a read line running underneath it.

▶ 3 FAQ answers on this page

Source: ai-trailer-maker `https://bunsy.io/ai-trailer-maker`

MAKE

AI B-roll for the shot you did not get

The missing cutaway, made to length.

- **Describe the missing shot for AI B-roll** — You already know what the shot is: hands on a keyboard, rain on a window, the street at dusk. Writing that sentence is faster than scrolling a library for something adjacent to it.
- **Match the footage it sits next to** — A cutaway that disagrees with the scene reads as an insert from another film. Pull a still out of your own footage and animate that, so the light and the look carry over instead of being described from memory.
- **It lands where the hole is** — The generator lives in the app the project lives in. The clip arrives on the timeline under the voice track and gets trimmed to the gap there, not exported out of one tool and back into another.

▶ 3 FAQ answers on this page

Source: ai-b-roll-generator `https://bunsy.io/ai-b-roll-generator`

MAKE

Trend videos while the trend is still running

A format has a short life. Use it early.

- **Start trend videos from current recipes** — Recipes go in while a format is still climbing and come out once it flattens, so what you start from is what is being rewarded this week rather than an archive of things that used to land.

- **Their structure, your subject** — What makes a trend recognisable is the timing, the framing and where the beat falls. Keep those, put your own subject inside them, and you borrow the format's reach without posting the same video as everyone else.
- **This evening, not next week** — Generation, the cut, the captions and the sound all happen on the phone in one sitting. Nothing waits on a laptop, an export or a second app, which is the only reason the window is reachable at all.

▶ 3 FAQ answers on this page

Source: ai-trend-videos `https://bunsy.io/ai-trend-videos`

06 FAQ — home page and pricing page

These live behind collapsed accordions on the site, so they do not show up if you only read the page source. Text below is the expanded answer, verbatim.

Home page FAQ (`https://bunsy.io/#faq`)

▼ 6 questions — click to collapse

Is the Bunsy AI video generator free to use?

Bunsy is free to download. AI generation uses credits from a subscription or a one-time pack. The cost of a render depends on the model and settings; current plans and credit packs are listed on the pricing page.

Which AI models can I generate with?

Bunsy offers a catalogue of AI video and image models. Choose a model for each generation and compare its supported modes and starting credit costs on the AI models page, which uses the same live catalogue as the app.

Do I need an account on the website?

No account is needed to read this website's product guides, model catalogue or pricing. To generate and edit videos, download Bunsy and sign in inside the mobile app.

Can I edit videos I did not generate in Bunsy?

Yes. Import clips and photos from your camera roll and cut them on the same timeline as generated footage, with subtitles, sound and retiming applied the same way.

Can I use what I make commercially?

Generally yes, subject to the Bunsy terms and acceptable use policy as well as the licence of the model that produced the clip. Check both before using a video in a paid campaign.

Is it on both iOS and Android?

Yes — Bunsy is available on the App Store and on Google Play, with the same generation catalogue and the same editor on both.

Pricing page FAQ (`https://bunsy.io/pricing`)

▼ 5 questions — click to collapse

What are credits?

Credits are a limited-use digital entitlement for generation, not cash. A subscription grants credits each billing period, and you can also buy one-time credit packs.

Do unused credits roll over?

Unused subscription credits do not roll over to the next period unless we say otherwise in the app.

How do I cancel a subscription?

Subscriptions bought in the app are cancelled in your Apple or Google account settings. For website billing, email support@bunsy.io.

Does pricing differ between the app and the website?

In the iOS and Android apps you pay Apple or Google at the localized store price. Website checkout is processed by Stripe, and the prices listed here are in EUR.

Is there a free plan?

Bunsy is a paid AI video app. The app itself is free to download, and generating runs on credits from a subscription or a one-time pack.

07 Legal & policy

Read this before you promise anything on Bunsy's behalf. The restrictions here are the ones most likely to bite a sponsorship deal.

Terms of Service

Last-referenced `https://bunsy.io/terms` · also available as a PDF from that page.

- **Who you are contracting with** — QUICK AI SOFTWARE SOLUTIONS HUB - FZCO, IFZA Business Park, DDP, PO Box 342001, Dubai, UAE. Binding from first use, including as a guest, or on buying credits.
- **Independence from model makers** — "We do not own those models, we are not affiliated with or endorsed by the model creators, and we do not guarantee any particular output."
- **Age** — 18+, or the higher age of majority where you live. One account per person.
- **Your content** — you keep rights in what you upload; you grant Bunsy a licence to host, transmit and display it, including sending inputs to third-party AI providers. **Your inputs and outputs are not used to train AI models except with separate opt-in consent.**
- **AI labels** — "You must not remove AI-generation labels or provenance signals." Relevant if a creator wants to post a clean export.
- **Likeness** — no deceptive impersonations of real people; no non-consensual intimate imagery; no fraud, harassment, defamation or political deception. If you upload a photo of a real person you must be that person or hold explicit, documented consent.
- **Liability cap** — limited to what you paid Bunsy in the three months before the claim.
- **IP complaints & appeals** — all notices go to support@bunsy.io. Repeat infringers can have accounts terminated.

NSFW is banned outright — this is the sharpest restriction on the site

Terms §5: "**You must not submit, generate, request, or distribute sexually explicit, pornographic, or NSFW content of any kind.** This includes sexual content involving adults, sexual nudity, fetish material, and sexually suggestive AI-generated images or video. Bunsy does not offer uncensored, unfiltered, 'no filter', or adult generation."

The Acceptable Use Policy repeats it and adds that attempts to bypass filters with coded language — "uncensored", "no filter", "18+" — are themselves a violation. "There is no setting that turns this rule off."

Acceptable Use Policy

Last updated 17 August 2026 (as printed on the page). Part of the Terms; covers the apps, website and APIs.

- **Prompts are screened** before image and video generation — but "screening does not mean every prohibited request will be caught", and you stay responsible for your prompts and uploads.
- **Absolutely banned** — child sexual exploitation, with no exception, including fictional depictions. Bunsy removes it, terminates the account and reports to authorities.

- **Also banned** — illegal content under UAE or local law; hate, terrorism, extreme violence or incitement; deceptive impersonation, fraud, harassment, defamation, political/electoral deception; uploading a real person's face, voice or likeness without consent; IP infringement; malware, abusive scraping, or evading rate limits or safety systems.
- **Enforcement** — Bunsy may refuse a generation, hide or delete content, and suspend or terminate accounts **without a refund** where the policy is broken.

Privacy Policy

- **Framework** — designed to comply with the UAE Federal Personal Data Protection Law (Federal Decree-Law No. 45 of 2021) and app-store disclosure rules.
- **Controller** — QUICK AI SOFTWARE SOLUTIONS HUB - FZCO, Trade License No. 80532, Registration No. 78782, Dubai, UAE.
- **Faces** — photographs uploaded to create an avatar are stored as ordinary images. "We do not run face recognition and do not create faceprints, templates, or embeddings."
- **No sale, no training** — "We do not sell personal data. We do not use your prompts, uploads, or generated content to train AI models except with separate opt-in consent."
- **Where data lives** — application servers, databases and object storage are in the European Union. Data may go to AI and payment providers outside the UAE and EU, including the United States.
- **Retention** — account data deleted within 7 days of a request (after a 7-day restore window); billing records kept as UAE tax/commercial law requires (typically 5 years); deleted content purged within 30 days, subject to backups.
- **Your rights** — access, correction, deletion, restriction, objection, portability, withdrawal of consent. Response within 30 days. Complaints go to the competent UAE authority.

Sub-processors — who actually touches the data

Bunsy publishes its full vendor list. Providers marked **Biometric** may receive facial images you upload to create avatars.

CATEGORY	PROVIDER	WHAT IT DOES
AI model / generation	KIE (kie.ai) Biometric	Unified generation API; routes to xAI (Grok Imagine), ByteDance (Seedream / Seedance), Kuaishou (Kling), Volcengine
	WaveSpeed Biometric	Unified inference API, including ElevenLabs dubbing
	fal.ai Biometric	Model inference
	OpenAI	LLM processing for the in-app assistant/agent

CATEGORY	PROVIDER	WHAT IT DOES
	Anthropic	LLM processing for the in-app assistant/agent
	OpenRouter	LLM routing for the in-app assistant/agent
	Mistral (Voxtral)	Speech-to-text transcription of submitted audio
Analytics & crash	Google Firebase Analytics	Product analytics
	Sentry	Error / crash reporting (mobile app)
Push	Google Firebase Cloud Messaging (FCM)	Push delivery (Android)
	Apple Push Notification service (APNs)	Push delivery (iOS)
Payments	Creem	Merchant of record for website checkout of subscriptions and credit packs
	Apple In-App Purchase	In-app purchases on iOS
	Google Play Billing	In-app purchases on Android
	Adapty	Subscription management, entitlements, payment analytics
Auth / identity	Google Sign-In	Sign-in and identity verification
	Sign in with Apple	Sign-in and identity verification
Social sharing	Meta / Facebook	Only where you choose to share to Facebook or Instagram Stories (no Facebook login or SDK tracking)

08 Contradictions & things to double-check

Places where Bunsy's own pages disagree. Quoting a stale figure in an outreach email is the fastest way to lose credibility, so check these against the live site before you send.

1. Who processes website payments — Stripe or Creem?

/pricing says Stripe, twice: in the page's meta description ("Bunsy pricing for AI video generation: compare subscription plans and one-time credit packs. Website payments are processed by Stripe.") and in the body ("Website checkout is processed by Stripe").

Three other pages say Creem. /terms §2: "Website checkout is processed by Creem as merchant of record." /privacy §2 and §4 name Creem for website checkout. /sub-processors lists only Creem under Payments, as merchant of record.

Three pages against one, and Creem is the name that appears in the legal and vendor documents — so **Creem is almost certainly correct and the pricing page is stale**. Don't repeat "Stripe" in any outreach.

2. How many models does Bunsy have — 32, or 5 families?

The landing page (/get, and the same section on the home page) says: "**32 models. One prompt box.** 22 for video and 10 for images across 12 model families… Counted from the app's live catalogue, refreshed hourly."

The catalogue page (/ai-models) says: "**5 model families, one picker**", and its comparison table lists exactly five — Grok Imagine, Runway, Veo 3.1, Nano Banana, GPT Image. Each model page repeats "Every family in the picker that publishes a number — 5 of them."

These are probably counting different things (individual model versions vs. families that publish credit prices), but as written they contradict. **Whichever you quote, cite the page you took it from.** The 5-family/table figure is the more defensible one because it names its members.

3. Wait times disagree between the table and the model pages

- **GPT Image 2.5** — comparison table says ~2 min; the GPT Image page header says "Fastest run ~89s".
- **Veo 3.1** — the page header says "From 54 credits / Fastest run ~4 min" while the table's 225-credit mode says ~5 min. Not strictly a conflict (different modes), but the page headline number is the cheaper Reference-to-Video mode, not the headline Veo 3.1 mode.

Bunsy's own disclaimer covers this: "Wait times are catalogue estimates." Treat all timings as approximate.

4. A sidebar blurb is truncated mid-sentence

On the Nano Banana and Grok Imagine model pages the "Also in the picker" card for Runway reads: "Runway's platform is utilized by major film studios, advertising agencies, and independent creators to streamline their production and visual effects…" — it ends in an ellipsis, cut off. Cosmetic, but it tells you the sidebar copy is not maintained as carefully as the main content, so prefer the main body text when quoting.

Seen on /ai-models/nano-banana-2 and /ai-models/grok-imagine

5. Two different phone numbers for the same term

Credits systems overlap awkwardly across the two purchase routes: a monthly Basic plan gives 800 credits for €15, while the €100 pack gives 7,500 for roughly the same money — 6.7× the credits for 6.7× the price, i.e. a pack buyer pays about 1.33¢/credit against 1.88¢/credit on monthly Basic. Useful context if a creator asks whether a subscription or a pack is better value for their volume.

Computed from /pricing — arithmetic is mine, not Bunsy's.

09 Sources

Every page this document draws on, with the date it was read. Bunsy says its catalogue is refreshed hourly and its sitemap carries `changefreq: weekly`, so re-check before relying on any number.
